DOT MATRIX LCD 80-OUT SEGMENT DRIVER

■ GENERAL DESCRIPTION

The NJU6446 is a serial input, 80-out segment driver for dot matrix LCDs, especially useful as extension driver for LCD controller drivers. It consists of bidirectional shift register, 80-bit latch, and 80-out high voltage LCD drivers.

The bidirectional shift register performs the efficient extension driver allocation according to the number of characters and easy wiring with the LCD panel.

As the 80-driver has 4 level voltage input to drive the LCD, adjustable driving voltage according to the LCD panel can be supplied from the external power source.

1～30 51～100	SEG_{30}～SEG_1 SEG_{80}～SEG_{31}	LCD segment driving terminal. Each terminal corresponds to each bit of shift register
41	DI	Data input terminal. The DI terminal is fixed the input terminal regardless the shift direction. Display data is input synchronized with the clock signal.
42	DO	Data output terminal. The DO terminal is fixed the output terminal regardless the shift direction. The data is output synchronized with the clock signal.
40	SCL	Shift register clock pulse input terminal. The data is shifted in the shift register by the falling edge of the clock pulse. A data setup time and hold time are required between data input and SCL. Clock pulse rising time and falling time should be set less than 50ns (MAX) respectively.
39	SHL	Shift direction select terminal. "H" : Shift direction is from 80th bit to 1st bit. "L" : Shift direction is from 1st bit to 80th bit. The DI and DO terminals are fixed input and output terminal respectively regardless this terminal input level.
37	LP	Latch pulse input terminal. The data in the shift register is latched to the Latch by this signal. "H" : Data writing, "L" : Data latch
44	LM	Alternate signal input for LCD driving.
46,36	V_{DD},V_{SS}	Power supply terminal (connect to the controller's V_{DD} terminal) Power supply terminal (connect to the controller's V_{SS} terminal)
