1 FEATURES

- Number of LCD drive outputs: 240
- Supply voltage for LCD drive: +15.0 to +30.0 V
- Supply voltage for the logic system: +2.5 to +5.5 V
- Low power consumption
- Low output impedance

(Segment mode)

- Shift clock frequency
 - 20MHz(MAX.): $V_{DD} = +5.0 \pm 0.5$ V
 - 15MHz(MAX.): $V_{DD} = +3.0$ to + 4.5 V
 - 12MHz(MAX.): $V_{DD} = +2.5$ to + 3.0 V
- Adopts a data bus system
- 4-bit/8-bit parallel input modes are selectable with a mode (MD) pin
- Automatic transfer function of an enable signal
- Automatic counting function which, in the chip selection mode, causes the internal clock to be stopped by automatically counting 240 bits of input data
- Line latch circuits are reset when /DISPOFF active

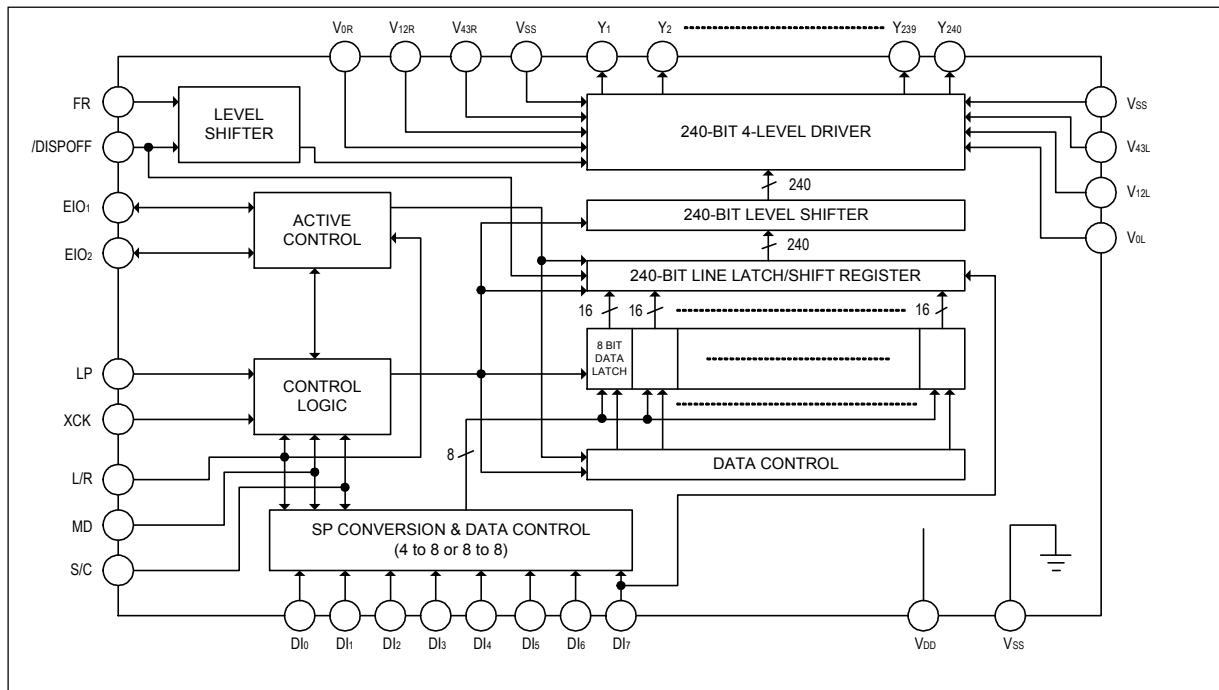

(Common mode)

- Shift clock frequency: 4 MHz (MAX.)
- Built-in 240-bit bi-directional shift register (divisible into 120 bits x 2)
- Available in a single mode (240-bit shift register) or in a dual mode (120-bit shift register x 2)
 - Y1->Y240 Single mode
 - Y240->Y1 Single mode
 - Y1->Y120, Y121->Y240 Dual mode
 - Y240->Y121, Y120->Y1 Dual modeThe above 4 shift directions are in-selectable
- Shift register circuits are reset when /DISPOFF active

2 DESCRIPTION

The ST8024S is a 240-output segment/common driver IC suitable for driving large/medium scale dot matrix LCD panels, and is used in personal computers/work stations. The ST8024S is good both as a segment driver and a common driver, and it can create a low power consuming, high-resolution LCD.

3 BLOCK DIAGRAM

4 FUNCTIONAL OPERATIONS OF EACH BLOCK

BLOCK	FUNCTION
Active Control	In case of segment mode, controls the selection or non-selection of the chip. Following an LP signal input, and after the chip selection signal is input, a selection signal is generated internally until 240 bits of data have been read in. Once data input has been completed, a selection signal for cascade connection is output, and the chip is non-selected. In case of common mode, controls the input/output data of bi-directional pins.
SP Conversion & Data Control	In case of segment mode, keeps input data which are 2 clocks of XCK at 4-bit parallel input mode in latch circuit, or keeps input data which are 1 clock of XCK at 8-bit parallel input mode in latch circuit; after that they are put on the internal data bus 8 bits at a time.
Data Latch Control	In case of segment mode, selects the state of the data latch which reads in the data bus signals. The shift direction is controlled by the control logic. For every 16 bits of data read in, the selection signal shifts one bit based on the state of the control circuit.
Data Latch	In case of segment mode, latches the data on the data bus. The latch state of each LCD drive output pin is controlled by the control logic and the data latch control; 240 bits of data are read in 30 sets of 8 bits.
Line Latch/Shift Register	In case of segment mode, all 240 bits which have been read into the data latch are simultaneously latched at the falling edge of the LP signal, and are output to the level shifter block. In case of common mode, shifts data from the data input pin at the falling edge of the LP signal.
Level Shifter	The logic voltage signal is level-shifted to the LCD drive voltage level, and is output to the driver block.
4-Level Driver	Drives the LCD drive output pins from the line latch/shift register data, and selects one of 4 levels (V0 , V12 , V43 or Vss) based on the S/C and /DISPOFF signals.
Control Logic	Controls the operation of each block. In case of segment mode, when an LP signal has been input, all blocks are reset and the control logic waits for the selection signal output from the active control block. Once the selection signal has been output, operation of the data latch and data transmission is controlled, 240 bits of data are read in, and the chip is non-selected. In case of common mode, controls the direction of data shift.

6 FUNCTIONAL DESCRIPTION

6.1 Pin Functions

(Segment mode)

SYMBOL	FUNCTION
V_{DD}	Logic system power supply pin, • Connected to +2.5 to +5.5 V.
GND	Ground pin
LGND	Logic ground pin • Do not short LGND with GND and Vss by ITO on LCD panel • Connect it to GND on PCB or FPC.
V _{ss}	Connect to GND by ITO on LCD panel.
V_{OL} , V_{OR} V_{12L} , V_{12R} V_{43L} , V_{43R}	Bias power supply pins for LCD drive voltage • Normally use the bias voltages set by a resistor divider • Ensure that voltages are set such that $V_{ss} < V_{43} < V_{12} < V_0$. • V_{iL} and V_{iR} ($i = 0, 12, 43$) must connect to an external power supply, and supply regular voltage which is assigned by specification for each power pin
DI ₇ -DI ₀	Input pins for display data • In 4-bit parallel mode, DI ₃ -DI ₀ are the display data input pins, and DI ₇ -DI ₄ must be connected to LGND or V_{DD} . • In 8-bit parallel mode, All DI ₇ -DI ₀ pins are the display data input pins. • Refer to section 6.2.2.
XCK	Clock input pin for taking display data • Data is read at the falling edge of the clock pulse.
LP	Latch pulse input pin for display data • Data is latched at the falling edge of the clock pulse.
L/R	Input pin for selecting the reading direction of display data • When set to LGND level "L", data is read sequentially from Y ₂₄₀ to Y ₁ . • When set to V_{DD} level "H", data is read sequentially from Y ₁ to Y ₂₄₀ . Refer to section 6.2.2.
/DISPOFF	Control input pin for output of non-select level • The input signal is level-shifted from logic voltage level to LCD drive voltage level, and controls the LCD drive circuit. • When set to LGND level "L", the LCD drive output pins (Y ₁ -Y ₂₄₀) are set to level V _{ss} . • When set to "L", the contents of the line latch are reset, but the display data are read in the data latch regardless of the condition of /DISPOFF. When the /DISPOFF function is canceled, the driver outputs non-select level (V ₁₂ or V ₄₃), then outputs the contents of the data latch at the next falling edge of the LP. At that time, if /DISPOFF removal time does not correspond to what is shown in AC characteristics, it can not output the reading data correctly. • Table of truth values is shown in "TRUTH TABLE" in Functional Operations.
FR	AC signal input pin for LCD drive waveform • The input signal is level-shifted from logic voltage level to LCD drive voltage level, and controls the LCD drive circuit. • Normally it inputs a frame inversion signal. • The LCD drive output pins' output voltage levels can be set using the line latch output signal and the FR signal. • Table of truth values is shown in "TRUTH TABLE" in Functional Operations.
MD	Mode selection pin • When set to LGND level "L", 8-bit parallel input mode is set. • When set to V_{DD} level "H", 4-bit parallel input mode is set. • Refer to section 6.2.2.
S/C	Segment mode/common mode selection pin • When set to V_{DD} level "H", segment mode is set.
EIO ₁ , EIO ₂	Input/output pins for chip selection • When L/R input is at LGND level "L", EIO ₁ is set for output, and EIO ₂ is set for input. • When L/R input is at V_{DD} level "H", EIO ₁ is set for input, and EIO ₂ is set for output. • During output, set to "H" while LP • XCK is "H" and after 240 bits of data have been

	<p>read, set to "L" for one cycle (from falling edge to failing edge of XCK), after which it returns to "H".</p> <ul style="list-style-type: none"> During input, the chip is selected while EI is set to "L" after the LP signal is input. The chip is non-selected after 240 bits of data have been read.

7 PRECAUTIONS

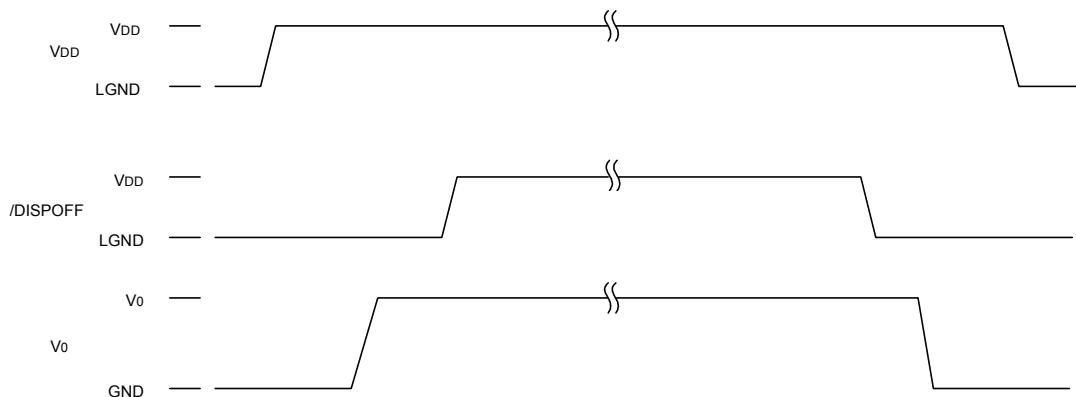

Precautions when connecting or disconnecting the power supply

This IC has a high-voltage LCD driver, so it may be permanently damaged by a high current which may flow if voltage is supplied to the LCD drive power supply while the logic system power supply is floating. The details are as follows,

- When connecting the power supply, connect the LCD drive power after connecting the logic system power. Furthermore, when disconnecting the power, disconnect the logic system power after disconnecting the LCD drive power
- It is advisable to connect the serial resistor (50 to 100 Ω) or fuse to the LCD drive power V_0 of the system as a current limiter. Set up a suitable value of the resistor in consideration of the display grade.

And when connecting the logic power supply, the logic condition of this IC inside is insecure. Therefore connect the LCD drive power supply after resetting logic condition of this IC inside on /DISPOFF function. After that, cancel the /DISPOFF function after the LCD drive power supply has become stable. Furthermore, when disconnecting the power, set the LCD drive output pins to level LGND on /DISPOFF function. Then disconnect the logic system power after disconnecting the LCD drive power.

When connecting the power supply, follow the recommended sequence shown here

11 APPLICATION CIRCUIT

11.1 Application Circuit for Module

11.2 LCD Panel Layout Example

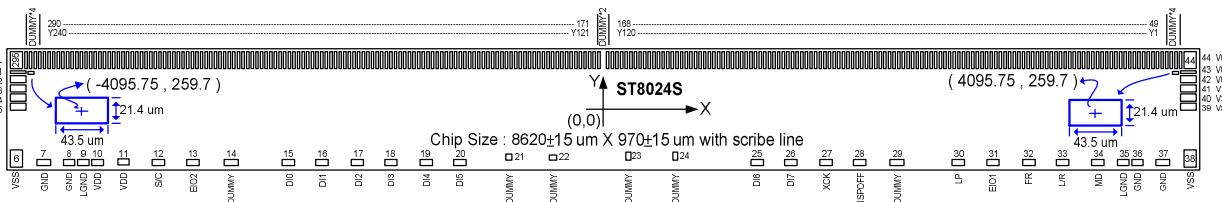

- R1 : $4.7\Omega \sim 50\Omega$
C1 : $0.1\mu F \sim 4.7\mu F$
C2 : $0.1\mu F \sim 4.7\mu F$
— Circuit on PCB
— Circuit on LCD

1. We suggest the ITO resistor for LCD panel is about $15\Omega/\text{Square}$, and the resistor value is as smaller as better.
2. Among the interface pins, please to be sure the ITO resistor value of power pins are less than the following values that we suggest.

Pin Name	ITO Resistor Values
LGND, GND, VDD, Vss	Less than 75Ω when $VDD < 2.7V$, and the smaller the better Less than 130Ω when $VDD > 2.7V$, and the smaller the better
V0R, V0L	Less than 200Ω , and the smaller the better
V12R, V12L, V34R, V12L	Less than 250Ω , and the smaller the better

13 REVISION

REVISION	DESCRIPTION	PAGE	DATE
0.10	First release	1-25	2005/9/12
0.20	Add LGND definition, and re-define the pin function	1-25	2005/11/22
0.30	Modify suggestion resistor value for V0. Add alignment mark data, Add LCD Panel Layout Example Modify bond pad height to 18um	21	2006/5/22
0.31	Modify bump pad height to 15um and add wafer thickness.	24	2006/6/7
0.32	Modify all Vss for logic setting pins to LGND	1-25	2006/7/21
0.33	Modify description of LGND	6-8	2006/7/21
0.34	Change Sitronix logo and modify description of LGND for COM mode	1-25	2006/7/21
0.35	Modify pad define and size for pad No.6 and No.38.	21-24	2006/7/24
0.36	Modify Chip size and thickness with scribe line Modify "Output resistance" test condition	16,22,24	2006/10/26
0.37	Modify Vo Max. voltage in "RECOMMENDED OPERATING CONDITIONS" and "ABSOLUTE MAXIMUM RATINGS" Modify the Max. Vo voltage to 40V for test condition Modify Vo Max. voltage in feature	2,15-18	2007/1/3
0.38	Modify all the data about absolute max voltage and recommend max voltage	2,15-18	2007/5/25
